## FEATURES

FORMULA designates a CASAPPA gear pump range specifically designed for applications requiring high pressure levels also at low speed; applications such as truck-mounted cranes, tripper trucks and lift-trucks etc. Special design features and an exclusive CASAPPA patent have perfected a sophisticated mechanism which makes FORMULA a highly reliable unit, proven by years of service in the specific field of use. The versatility offered by the range of Italian (triangular) European (ISO) and American (SAE) mounting flanges allows to the FORMULA pumps to be used in several applications.

### DISPLACEMENTS

From 0.50 in<sup>3</sup>/rev (8,26 cm<sup>3</sup>/rev)  
To 9.20 in<sup>3</sup>/rev (150,79 cm<sup>3</sup>/rev)

### PRESSURE

Max. continuous 4205 psi (290 bar)  
Max. intermittent 4568 psi (315 bar)  
Max. di peak 4713 psi (325 bar)

### MAX. SPEED

Max. 3000 min<sup>-1</sup>

- Two piece cast iron housing
- High performance at very low speed
- Ideal for truck applications

1	Mounting flange
2	Seals
3	Gear
4	Body
5	Thrust plates
6	Shaft
7	Outboard bearing

**Modification from former edition.**

## FEATURES

### WARNING !

Failure or improper use of the product can cause damage at the same product or system.

Make sure that this is the last issue.

Replaces: 02/07.2008

Construction	External gear type pumps
Mounting	ISO (ZF), ITALIAN (triangular) and SAE flanges
Line connections	Screw
Direction of rotation (looking at the drive shaft)	Anti-clock (S) - clockwise (D) - reversible (R or B)
Inlet pressure range for pumps	10 ÷ 44 psi - [0,7 ÷ +3 bar (abs.)]
Fluid temperature range	See table (1)
Fluid	Mineral oil based hydraulic fluids to ISO/DIN and fire resistant fluids [see table (1)]. For other fluids please consult our technical sales department.
Viscosity range	From 60 to 456 SSU [12 to 100 mm <sup>2</sup> /s (cSt)] recommended Up to 3410 SSU [750 mm <sup>2</sup> /s (cSt)] permitted
Filtering requirement	See table (2)
Antioxidant protection	Red paint IC105

**Tab. 1**

Type	Fluid composition	Max pressure psi - (bar)	Max speed min <sup>-1</sup>	Temperature °F - (°C)			Seals (◆)
				Min	Max continuous	Max peak	
ISO/DIN	Mineral oil based hydraulic fluid to ISO/DIN	See page 5 - 6 - 7	See page 5 - 6 - 7	-13 (-25)	176 (80)	212 (100)	<b>N</b>
				-13 (-25)	230 (110)	257 (125)	<b>V</b>
HFA	Oil emulsion in water 5 ÷ 15% of oil	725 (50)	1500	36 (2)	131 (55)	–	<b>N</b>
HFB	Water emulsion in oil 40 % of water	1740 (120)	1500	36 (2)	140 (60)	–	<b>N</b>
HFC	Water - glycol	1450 (100)	1500	-4 (-20)	140 (60)	–	<b>N Bz</b>
HFD	Phosphate ester (●)	2175 (150)	1500	14 (-10)	176 (80)	–	<b>V Bz</b>

(◆) **N** = Buna N (standard) - **V** = Viton - **N Bz** = Buna N and Bronze thrust plates - **V Bz** = Viton and Bronze thrust plates.

(●) For skydrol phosphate esters please consult our technical sales department.

**Tab. 2**

Working pressure psi (bar)	$\Delta p < 2030$ (140)	$2030 < \Delta p < 3045$ (140) (210)	$\Delta p > 3045$ (210)
Contamination class NAS 1638	10	9	8
Contamination class ISO 4406:1999	21/19/16	20/18/15	19/17/14
Achieved with filter $\beta_{10(c)} \geq 200$ according to ISO 16889	–	10 $\mu$ m	10 $\mu$ m
Achieved with filter $\beta_{25(c)} \geq 200$ according to ISO 16889	25 $\mu$ m	–	–

Casappa recommends to use its own production filters:

## FEATURES

### DEFINITION OF ROTATION DIRECTION LOOKING AT THE DRIVE SHAFT

**ANT-CLOCK ROTATION**

**CLOCKWISE ROTATION**

**REVERSIBLE ROTATION**

## PRESSURE DEFINITION

$p_1$  Max. continuous pressure  
 $p_2$  Max. intermittent pressure  
 $p_3$  Max. peak pressure

## GENERAL NOTES

Available with different inlet and outlet ports. Standard pumps are equipped with BUNA N (N) seals, for particular operating conditions (V) VITON seals and BUNA or VITON seals with bronze thrust plates (N Bz), (V Bz) are available. If you use fire resistant fluids specify the type of them at the order. For more information please consult our technical sales department.

<b>FP 30•51</b>	3.16 (51,83)	3480 (240)	3770 (260)	4060 (280)	2500	3500	300
<b>FP 30•61</b>	3.74 (61,26)	3190 (220)	3480 (240)	3625 (250)	2000	3500	300
<b>FP 30•73</b>	4.50 (73,82)	2900 (200)	3190 (220)	3335 (230)	1800	3500	300
<b>FP 30•82</b>	4.98 (81,68)	2755 (190)	3045 (210)	3190 (220)	1800	3500	300
<b>FP 30•100</b>	6.16 (100,52)	2610 (180)	2900 (200)	3190 (220)	1800	3500	300
<b>FP 30•125</b>	7.67 (125,66)	2320 (160)	2610 (180)	2900 (200)	1800	3500	300

$p_1$ = Max. continuous pressure

$p_2$ = Max. intermittent pressure

$p_3$ = Max. peak pressure

The values in the table refer to unidirectional pumps.  
 Reversible pump max pressures are 15% lower than those shown in table.  
 For different working conditions please consult our sales department.

T2 type double shaft flange allow the pumps to work in clockwise or anticlockwise rotation obtaining the reversible advantages and maintaining the general data of unidirectional pumps.

01/08.2005

01/08.2005

## MULTIPLE PUMPS

FORMULA series pumps can be coupled together in combination. Where input power requirement of each element varies, that with the greater requirement must be at the drive shaft end, and progressively smaller to the rear.

Features and performances are the same as the corresponding single pumps, but pressures must be limited by the transmissible torque of the drive and connecting shafts. To have appropriate data, use the formula below.

The maximum rotational speed is that of the lowest rated speed of the single units incorporated.

Replaces: 01/08.2005

<b>M</b>	lbf in [Nm]	Torque
<b>V</b>	in <sup>3</sup> /rev [cm <sup>3</sup> /rev]	Displacement
<b>Δp</b>	psi [bar]	Pressure
$\eta_{hm} = \eta_m (V, \Delta p, n)$	(≈ 0,90)	Hydro-mechanical efficiency

$$M = \frac{M_{theor.}}{\eta_{hm}} \quad [Nm]$$

$$M_{theor.} = \frac{\Delta p \text{ (bar)} \cdot V \text{ (cm}^3\text{/rev)}}{62,83}$$

### DRIVE SHAFT SELECTION

The torque absorbed from the shaft of the first pump results from the sum of the torques due to all single stages. The achieved value must not exceed the maximum torque limit given for the shaft of the first pump. Diagrams providing approximate selection data will be found on page 38.

03/05.2013

#### Example

Let us consider a double pump FP40•63+ FP30•61. If we suppose that we have to work with the first pump at a pressure of 2900 psi (200 bar) and the second pump at a pressure of 2175 psi (150 bar), the graph 1 shows that the torque absorbed by FP40•63 is 1974 lbf in (223 Nm) and the graph 2 shows that the torque absorbed by FP30•61 is 1416 lbf in (160 Nm) [acceptable value because it don't exceed the maximum drive shaft torque that is 2478 lbf in (280 Nm), see page 42]. The torque to be transmitted by the first drive shaft will thus be 1974+1416=3390 lbf in (223+160= 383 Nm), this value must not exceed the shaft's maximum rated value.

## APPLICATIONS FOR FORMULA PUMPS WITH ZF P.T.O.(ISO STANDARD)

D100-108/1003

The FORMULA pumps in the application with radial load can be directly connected to the “ZF” P.T.O.

D100-D85/0493

The FORMULA pumps in the application with radial load can be directly connected to the “ZF” P.T.O. with straight teeth gear using the SR9 support.

01/08.2005

## APPLICATIONS FOR FORMULA PUMPS WITH ZF P.T.O.(ISO STANDARD)

The FORMULA pumps in the application without radial load can be directly connected to the “ZF” P.T.O. only on self sealed version using the SL9 support.

01/08.2005

D100-D86/0493

Use SL9 support to apply the universal joint.

## CHANGING ROTATION

### Example of changing rotation: from FP30 pump counterclockwise to clockwise

To change rotation of unidirectional pumps is necessary to operate in the following way:

1. Clean the pump externally with care.
2. Loosen, and remove, the clamp bolts (1)
3. Coat the sharp edges of the drive shaft (4) with adhesive tape and smear a layer of clean grease on the shaft end extension to avoid damaging the lip of the shaft seal when removing the mounting flange.
4. Remove the mounting flange (2), taking care to keep the flange as straight as possible during removal. If the flange is stuck, tap around the edge with a fibre or rubber mallet in order to break away from the body. Ensure that while removing the front mounting flange, the drive shaft and other components remain position.
5. Ease the drive gear (4) up to facilitate removal the front plate (3), taking care that the precision ground surfaces do not become damaged, and remove the drive gear.
6. Remove the driven gear (5) without overturning. The rear plate has not to be removed.
7. Re-locate the driven gear (5) in the position previously occupied by the drive gear (4)
8. Re-locate the drive gear (4) in the position previously occupied by the driven gear (5)
9. Replace the front plate (3) in its original position.
10. Remove the grub screw (6) from the mounting flange (2) and re-locate it in the other threaded hole in the same flange.
11. Gently wipe the machined surface of the mounting flange (2) and the body with a flat hand stone.
12. Refit the front mounting flange (2) turned 180° from its original position.
13. Refit the clamp bolts (1) with the washers and tighten in a crisscross pattern to a torque value of  $70 \pm 7$  Nm ( $558 \div 682$  lbf in).
14. Check that the pump rotates freely when the drive shaft (4) is turned by hand. If not a pressure plate seal may be pinched.
15. The pump is ready for installation with the original rotation reversed.

---

## INSTRUCTIONS

---

### INSTALLATION

The direction of rotation of single-rotation pumps must be the same as that of the drive shaft. Check that the coupling flange correctly aligns the transmission shaft and the pump shaft, the connection do not generate an axial or radial load on the pump shaft

### TANK

Tank capacity must be sufficient for the system's operating conditions ( ~ 3 times the amount of oil in circulation) to avoid overheating of the fluid. A heat exchanger should be installed if necessary. The intake and return lines in the tank must be spaced apart (by inserting a vertical divider) to prevent the return-line oil from being taken up again immediately.

### LINES

The lines must have a major diameter which is at least as large as the diameter of pump ports, and must be perfectly sealed. To reduce loss of power, the lines should be as short as possible, reducing the sources of hydraulic resistance (elbow, throttling, gate valves, etc.) to a minimum. A length of flexible tubing is recommended to reduce the transmission of vibrations. All return lines must end below the minimum oil level, to prevent foaming. Before connecting the lines, remove any plugs and make sure that the lines are perfectly clean

### FILTERS

We recommend filtering the entire system flow. Filters on suction and return line must be fitted in according to the contamination class as indicated in the first pages of the catalogue. Casappa recommends to use its own production filters:

### HYDRAULIC FLUID

Use hydraulic fluid conforming to the table as specified in the first pages of the catalogue. Avoid using mixtures of different oils which could result in decomposition and reduction of the oil's lubricating power.

### STARTING UP

Check that all circuit connections are tight and that the entire system is completely clean. Insert the oil in the tank, using a filter. Bleed the circuit to assist in filling. Set the pressure relief valves to the lowest possible setting. Turn on the system for a few moments at minimum speed, then bleed the circuit again and check the level of oil in the tank. Then gradually increase the pressure and speed of rotation until the pre-set operating levels as specified in the catalogue are attained.

### PERIODICAL CHECKS - MAINTENANCE

Keep the outside surface clean especially in the area of the drive shaft seal. In fact, abrasive powder can accelerate wear on the seal and cause leakage. Replace filters regularly to keep the fluid clean. The oil level must be checked and oil replaced periodically depending on the system's operating conditions.

01/08.2005

Our policy is one of continuous improvement in product. Specification of items may, therefore, be changed without notice.
